

What is a ground-mounted photovoltaic?

The first type, ground-mounted photovoltaic, has a fixed tilt angle for a fixed period of time. The second type uses a solar tracker system that follows Sun direction so that the maximum power is obtained. The solar tracking can be implemented with two axes of rotation (dual-axis trackers) or with a single axis of rotation (single-axis trackers).

Does a ground-mounted photovoltaic power plant have a fixed tilt angle?

A ground-mounted photovoltaic power plant comprises a large number of components such as: photovoltaic modules, mounting systems, inverters, power transformer. Therefore its optimization may have different approaches. In this paper, the mounting system with a fixed tilt angle has been studied.

What affects the gap between photovoltaic modules in the north-south direction?

(iv) The gap between the photovoltaic modules in the North-South direction is affected by the longitudinal spacing for maintenance, and it gives rise to a smaller influence of the parameter length of the rack configuration on the number of photovoltaic modules that can be installed in that direction.

Can geospatial data be used for photovoltaic plants?

A geospatial analysis of satellite imagery of plot areas has been used for the determination of the available land areas for the installation of photovoltaic plants. An open-source geographic information system software, QGIS, has been used. This software permits the conversion, visualization and analysis of geospatial data.
