Can solar panels be used on agricultural land?

Solar panels on agricultural land improve land-use efficiency, crop yields, and energy generation. In this work different technical aspects such as height, interspacing, configurations, solar PV technologies and innovations have been elaborated, with impact on power generation and crop yield.

Can farmland be used for solar energy?

There is significant opportunity to produce large amounts of solar energy on farmland. Agricultural land in the U.S. has the technical potential to provide 27 terawatts of solar energy capacity. This is a quarter of the total U.S. solar energy capacity of 115 TW. Only 0.3% of farmland is expected to be used for solar energy by 2035.

How can farmers benefit from solar energy?

Farmers can benefit from solar energy in several ways--by leasing farmland for solar; installing a solar system on a house, barn, or other building; or through agrivoltaics. Agrivoltaics is defined as agriculture, such as crop production, livestock grazing, and pollinator habitat, located underneath solar panels and/or between rows of solar panels.

Should a farmer own the land for a solar PV system?

In many cases, however, the land is not owned by the farmer. Ownership of the PV system is probably less common for larger agrivoltaic systems as well, increasing the likelihood of external investments. Partial ownership could help to maintain the incentive structure for the synergetic dual use of land in this case.

Should solar energy be used in farm applications?

As a result, scientists, researchers, and academicians are currently investigating the necessity for employing solar energy technologies in farm applications to maximize crop productivity and provide economic stability, while minimizing environmental impacts.
