How does a wind generator work?

The generator turns that rotational energy into electricity. At its essence, generating electricity from the wind is all about transferring energy from one medium to another. Wind power all starts with the sun. When the sun heats up a certain area of land, the air around that land mass absorbs some of that heat.

What is a wind turbine generator?

What is a wind turbine? A wind turbine, or wind generator or wind turbine generator, is a device that converts the kinetic energy of wind (a natural and renewable source) into electricity. Whereas a ventilator or fan uses electricity to create wind, a wind turbine does the opposite: it harnesses the wind to make electricity.

How does a wind turbine work?

The turbine's blades, which are like the propellers of an airplane or helicopter, use the aerodynamic force of the wind to turn a rotor, which spins a generator. This process produces electricity, which is usually fed into the grid. The wind turbines that transfer electricity to the grid are either based on land (onshore) or at sea (offshore).

Can a wind turbine generate electricity from a high wind speed?

In this way, the turbine is capable of generating electricity from high wind speeds. During high wind speed, turbulence can occur due to the turbine tower; therefore, the rotor is placed in front of the tower. The blades of wind turbines are also made rigid to withstand the load caused by high winds.

How does a wind turbine convert kinetic energy into electricity?

Basically, the wind's kinetic energy is converted into mechanical energy by the rotor. A gear box transforms the blades' slow rotations (between 18 and 25 per minute) into faster rotations (up to 1,800 per minute) that can power the electric generator. The electric generator converts the mechanical energy into electricity.

How much power does a wind turbine produce?

Most large turbines produce their maximum power at wind speeds around 15 meters per second (33 mph). Considering steady wind speeds, it's the diameter of the rotor that determines how much energy a turbine can generate.
